## **IN THE CLAIMS:**

The following listing of claims will replace all prior versions, and listings, of claims in the application.

1. (Currently amended) A digitally controlled oscillator, comprising:

an analog [[a]] preconditioner, wherein the <u>analog</u> preconditioner <u>is operable to</u> receive receives an input clock signal, wherein the <u>preconditioner receives and</u> a master clock signal, wherein the <u>analog</u> preconditioner <u>is configured to output outputs</u> a modified clock signal that is synchronized to the master clock signal, wherein the <u>analog</u> preconditioner is configured to noise shape phase noise of the synchronization to higher frequencies; and

a digital phase locked loop coupled to receive the modified clock signal output from the <u>analog</u> preconditioner, wherein the digital phase locked loop <u>is</u> also <u>operable to receive receives</u> the master clock signal, wherein the digital phase locked loop <u>is</u> <u>configured to output outputs</u> an output clock signal, wherein the output clock signal is a version of the input clock signal synchronized to the master clock signal [[;]]

wherein the digital phase locked loop does not introduce phase noise to the synchronized version of the input clock signal.

 (Currently amended) The digitally controlled oscillator of claim 1, wherein the preconditioner operates to noise shape phase noise of the synchronization to higher frequencies;

wherein the digital phase locked loop operates is configured to remove the phase noise at the higher frequencies.

- 3. (Currently amended) The digitally controlled oscillator of claim 2, wherein the analog preconditioner has a higher bandwidth than the digital PLL.
- 4. (Currently amended) The digitally controlled oscillator of claim 1,

wherein the <u>analog</u> preconditioner includes a loop having a loop gain, wherein the loop gain operates to attenuate phase noise introduced internal to the <u>analog</u> preconditioner.

- 5. (Currently amended) The digitally controlled oscillator of claim 1, wherein the <u>analog</u> preconditioner comprises:
- a phase detector including a first input which <u>is operable to receive receives</u> the input clock signal and a second input, wherein the phase detector <u>also</u> includes an output;
- a loop filter <u>having including</u> an input coupled to the output of the phase detector and <u>also</u> including an output;
- a voltage controlled oscillator (VCO) having including an input coupled to the output of the loop filter and also including an output;
- a latch having including an input coupled to the output of the VCO, an input which is operable to receive receives the master clock signal, and also including an output which is operable to generate generates the modified clock signal, wherein the latch is configured to synchronize synchronizes the modified clock signal to the master clock signal, wherein the output of the latch is coupled to the second input of the phase detector to provide the modified clock signal to the phase detector.
- (New) The digitally controlled oscillator of claim 5,
  wherein the analog preconditioner is configured to noise shape phase noise of the
  VCO to higher frequencies.
